

### How to create island unit in KDmax:

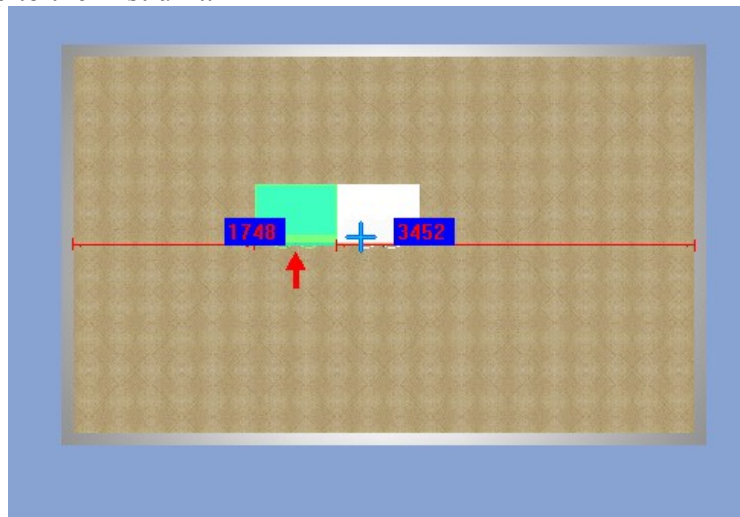

To create island unit, use “Special Position on Floor” function to layout the cabinet. First must set the elevation of the base unit for the plinth.

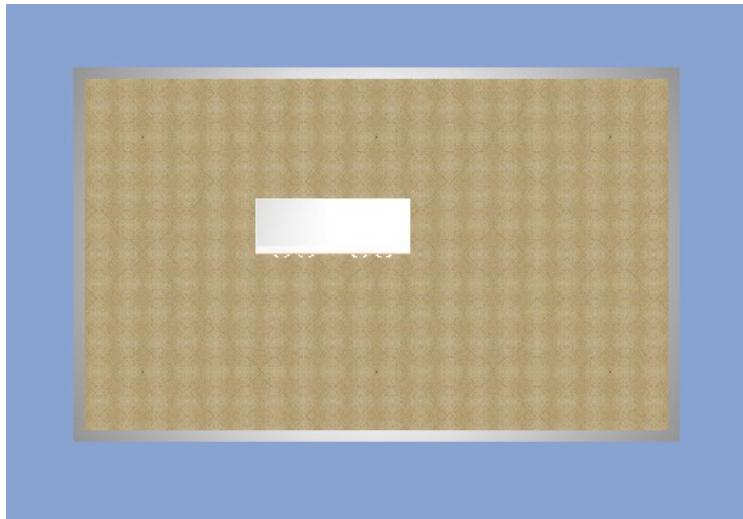

Move the mouse or input the distance to layout the cabinet.

After layout the first unit, ones can use "On Toekick" function to layout the others. It will automatically snap to the first unit.

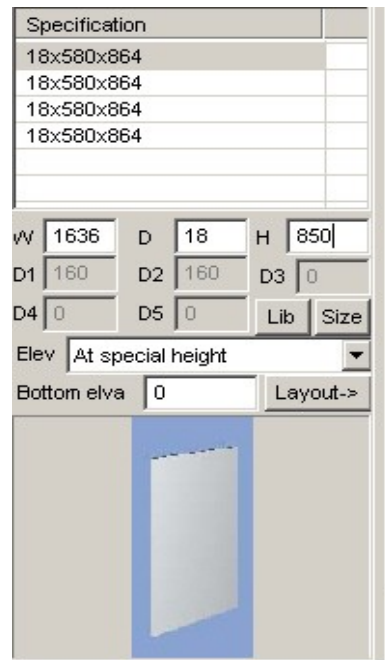

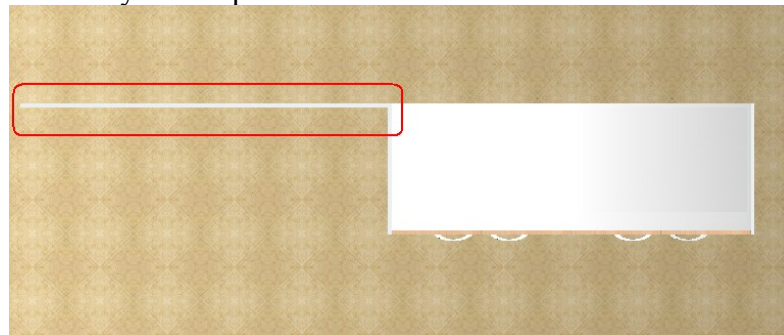

Layout the end panels on the left side and right side of the base unit.

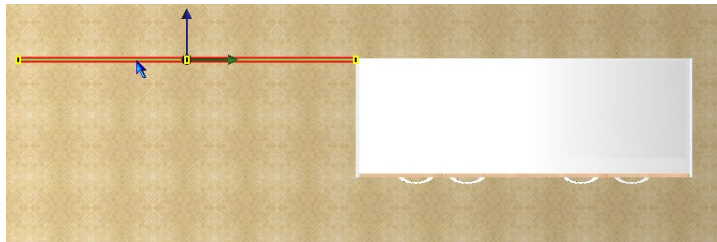

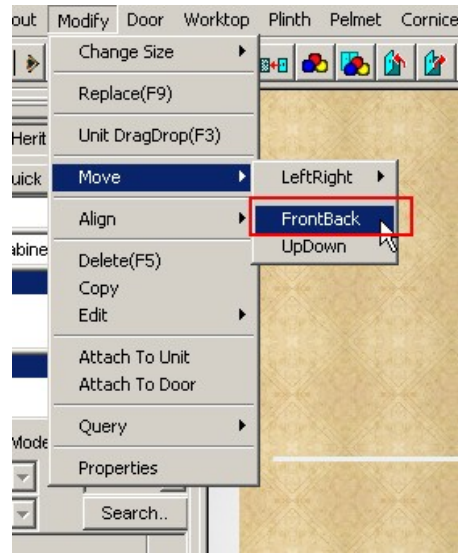

Now, layout the end panels on the backside of the units.  
First, modify the size of the panel to fit the units.

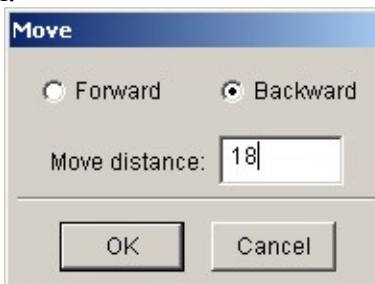

Then go to top view and layout the panel next to the units.

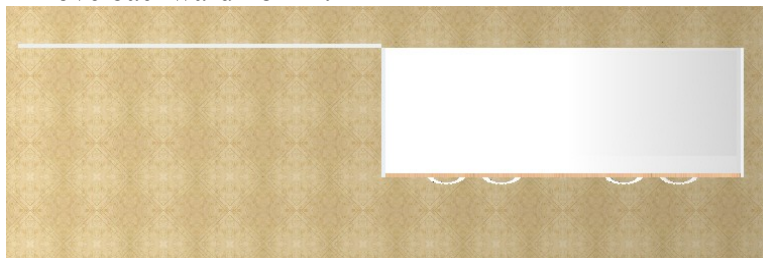

Now, move the panel backward. For example, if the panel's thickness is 18mm, then must move the panel backward 18mm to make it attach to the back of the units. Use the "move" function to achieve this. Go to "Modify→Move→FrontBack", and left click to select the panel.

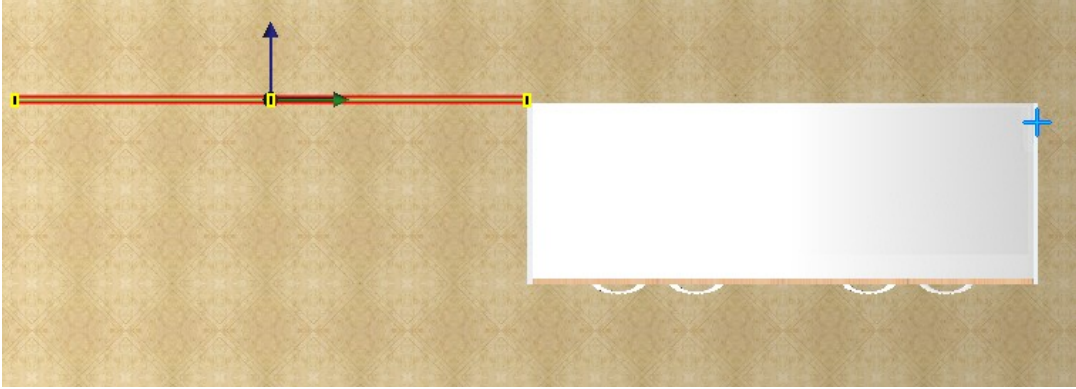

Right click to confirm. Then it will appear a dialogue to set the distance of the panel's moving. Click "OK" to finish.

The panel will move backward 18mm.

Now use the "Align" function to move the panel to the back of the units. Go to "Modify→Align→RightSide", and left click to select the panel. Then right click to confirm and select the end panel on the right side.

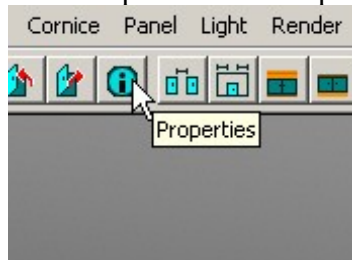

The panel will move and fix the units.

Normally, the end panel of the island will not install plinth. Here ones can cancel the plinth installation function of the end panel.

Use the “properties” function to cancel the plinths of each panel.

Left click to select the panel. It will appear the properties dialogue. Here select the “install properties”, and click “Modify” button.

No.	Attribute	Value
1	Name	Base Cabinet End Panel
2	ModelNo	W-00388
3	Code	
4	Need Quotation	Yes
